# BSM Higgs Search Motivation

- Many BSM theories predict additional Higgs Bosons.
- BSM can enhance rare decay modes of  $H(125)$  boson.
- Two Higgs Doublet Model (2HDM, e.g. MSSM)

- 5 Higgs Bosons

$$h, H, A, H^+, H^-$$

- Widely used as a benchmark for BSM Higgs searches.

- 2HDM+Singlet (e.g. NMSSM)

- 7 Higgs Bosons

- 5 of 2HDM, with 2 additional neutral bosons (1 CP-even and 1 CP-odd)

$$h_1, h_2, h_3, H^+, H^-, a_1, a_2$$

- Many other models are searched for at LHC.

- I will present a small subset of newest and moderately new results among many BSM Higgs results from ATLAS and CMS.

# Large Hadron Collider (LHC)

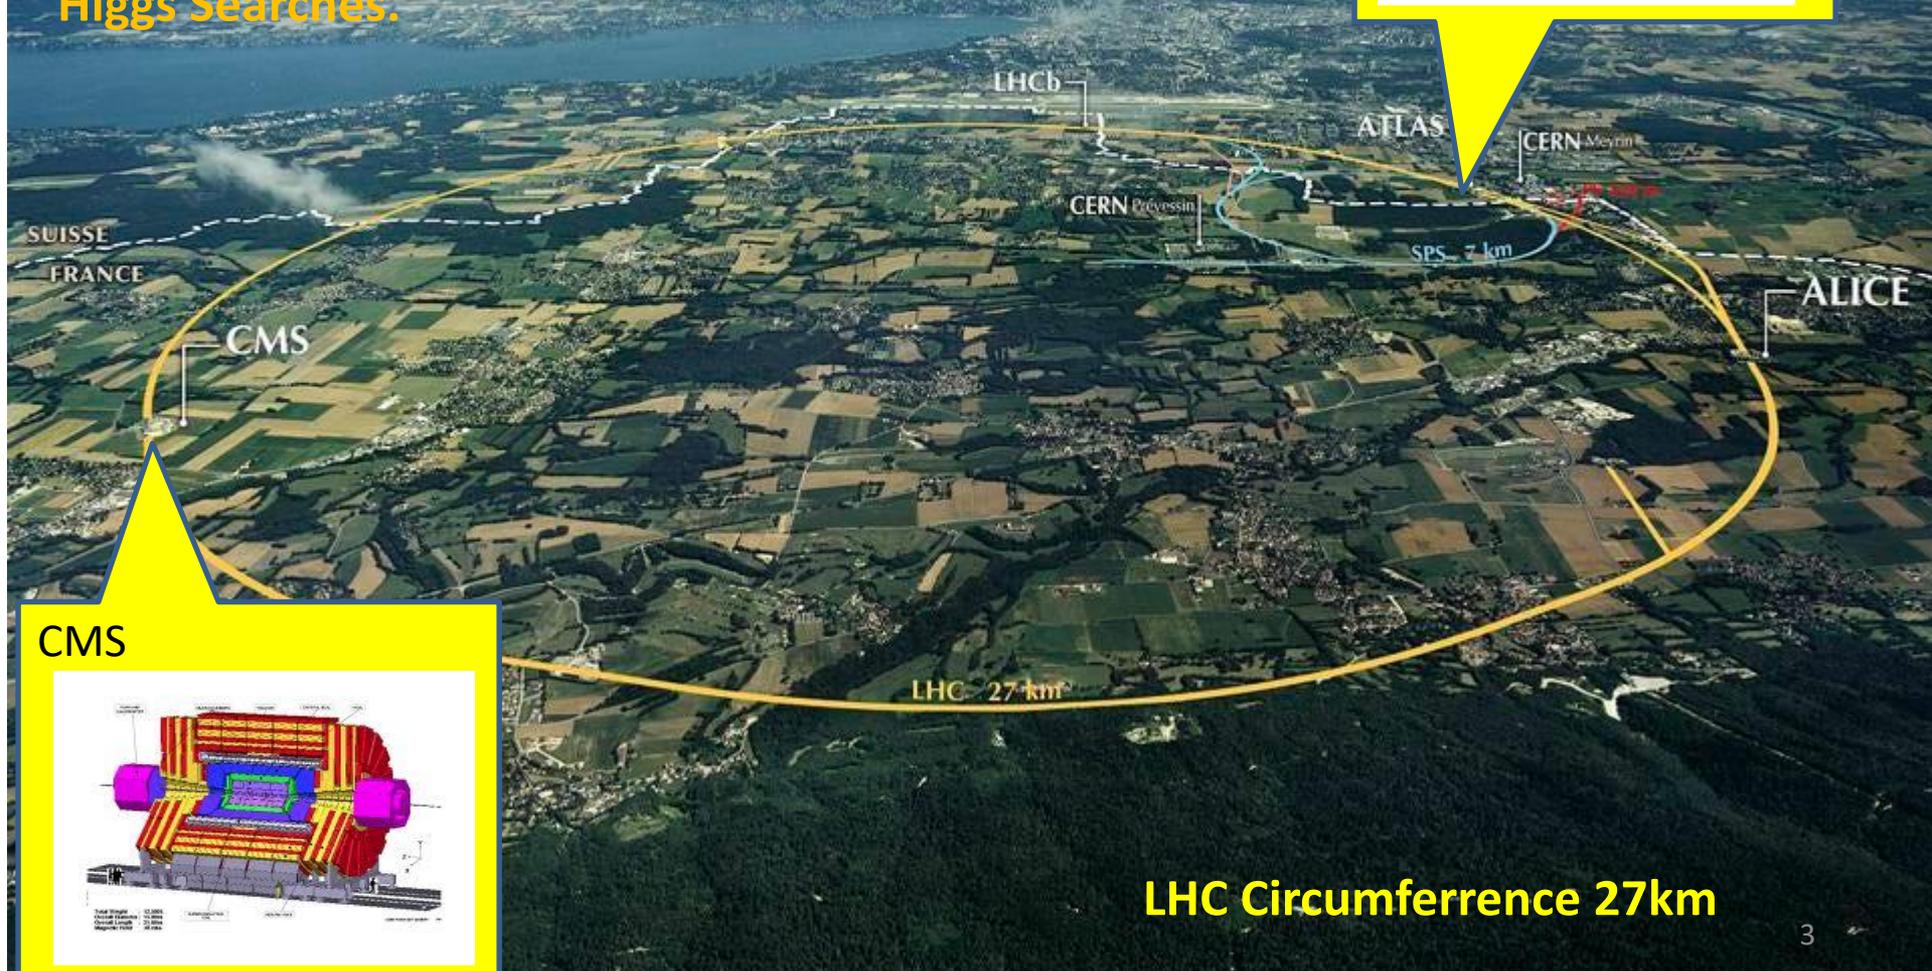

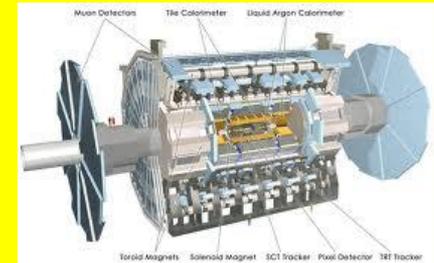

Particle physics experiment at the highest energy

$p - p$  collisions at  $E_{CM} \leq 14$  TeV

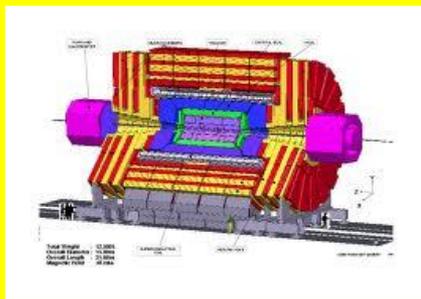

Broad physics program at ATLAS and CMS, including BSM

Higgs Searches.

## ATLAS

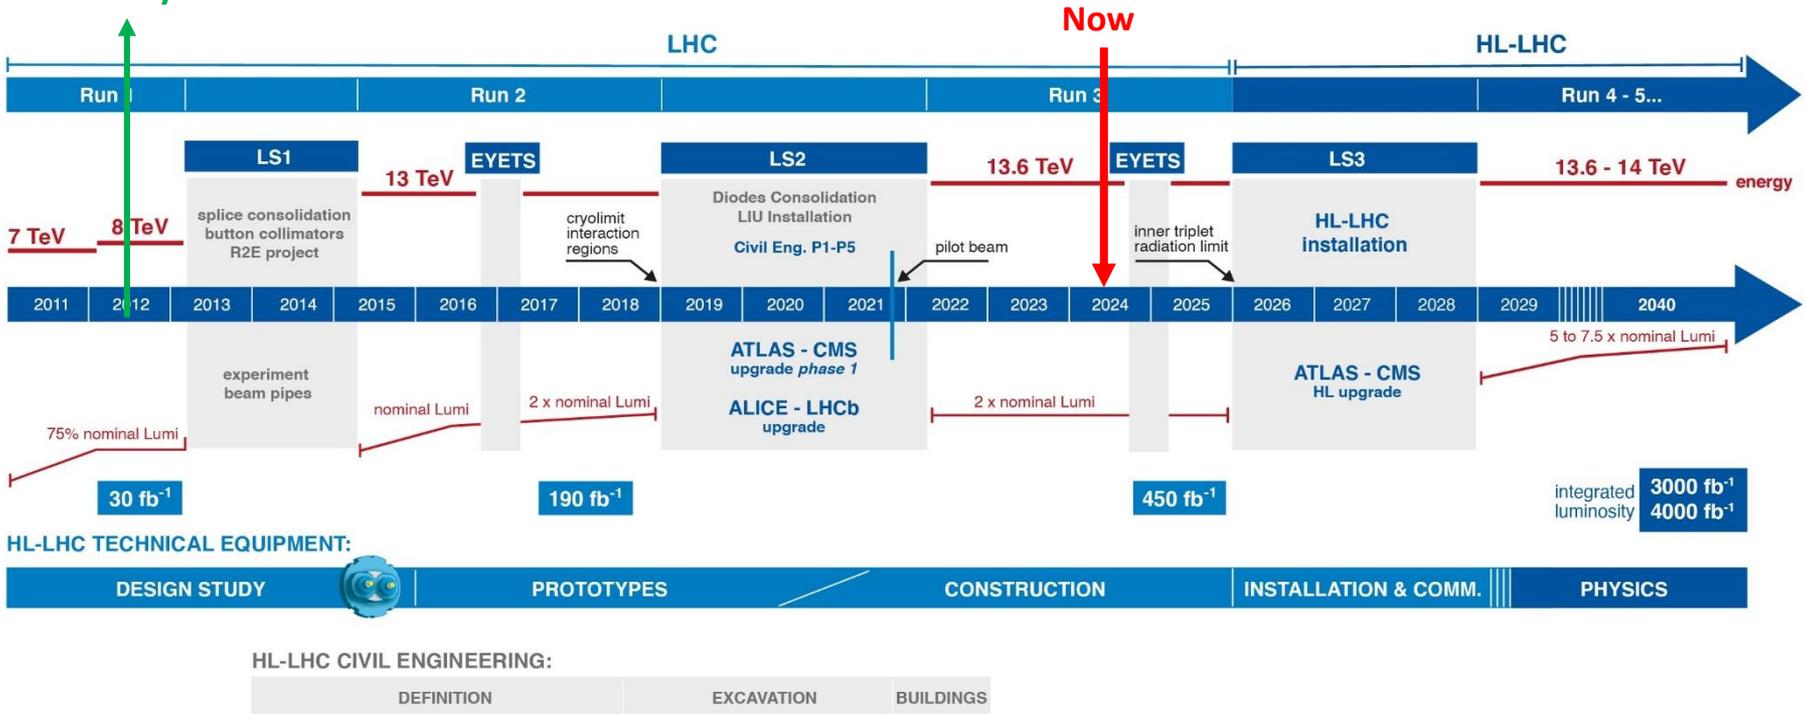

## CMS

LHC Circumference 27km

Higgs Boson  
Discovery

# LHC Long Term Schedule

- Each Exp. Collected  $\sim 100 \text{ fb}^{-1}$  in Run 3.
- Many analyses still working on Run 2 dataset.
- Analysis groups starting to work on Run 3 data.

	year	$E_{CM}(\text{TeV})$	integ lumi [fb <sup>-1</sup> ]
Run 1	2011	7	5
	2012	8	21
Run 2	2015-2018	13	139
Run 3	2022-2025	13.6	250
HL-LHC	2029-2038	14	3000

# Searches in 2HDM/MSSM Regime

- 2HDM and MSSM are widely used as a theoretical benchmark for BSM Higgs searches.
- 5 Higgs bosons

$$h, H, A, H^+, H^-$$

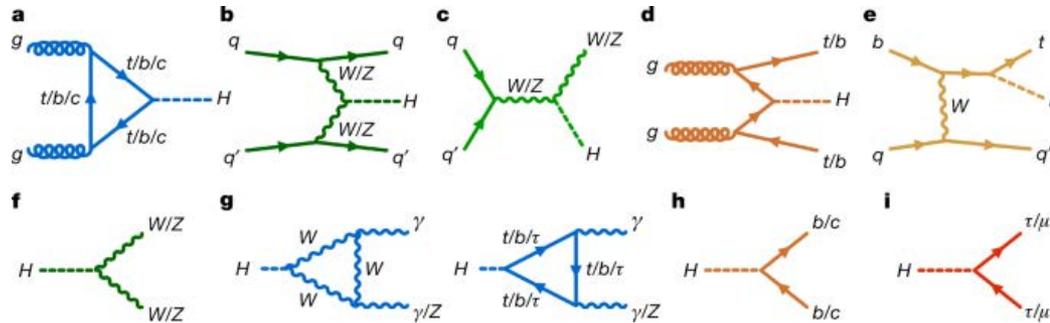

# Higgs Discovery in 2012

- ATLAS and CMS reported discovery of Higgs boson on July 4, 2012.
- Englert and Higgs won the Nobel prize in 2013.

# H(125) Measurements

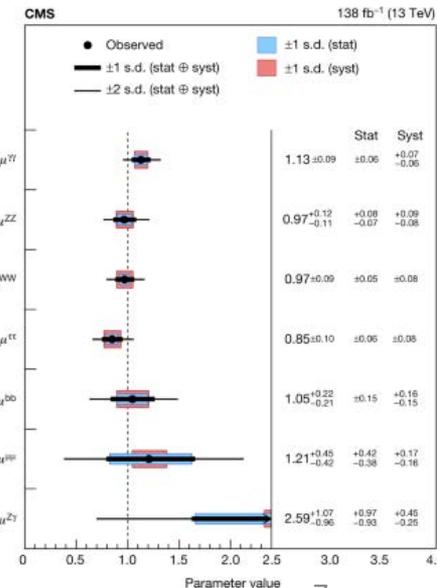

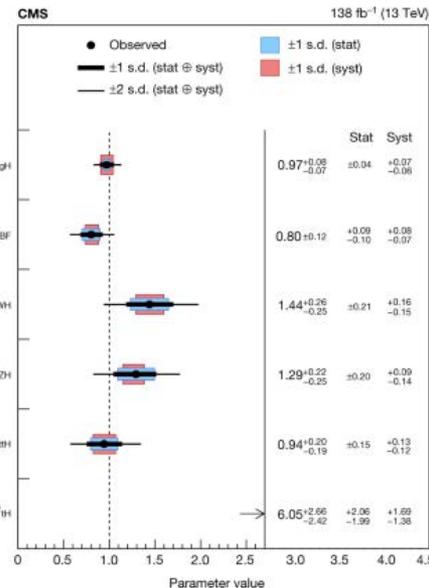

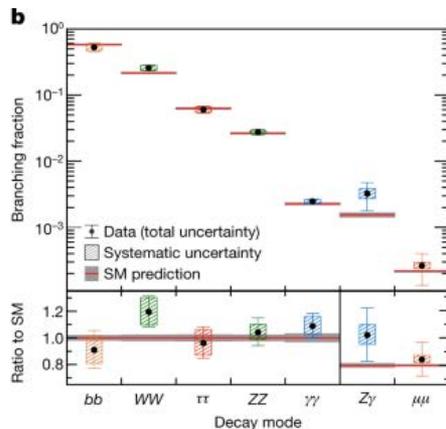

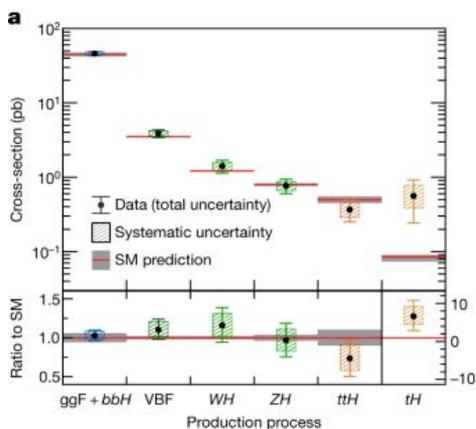

- Both collaborations have measured H(125) properties.
- Results are consistent with SM.

[Nature 607, 52–59 \(2022\)](#)

[Nature 607, 60–68 \(2022\)](#)

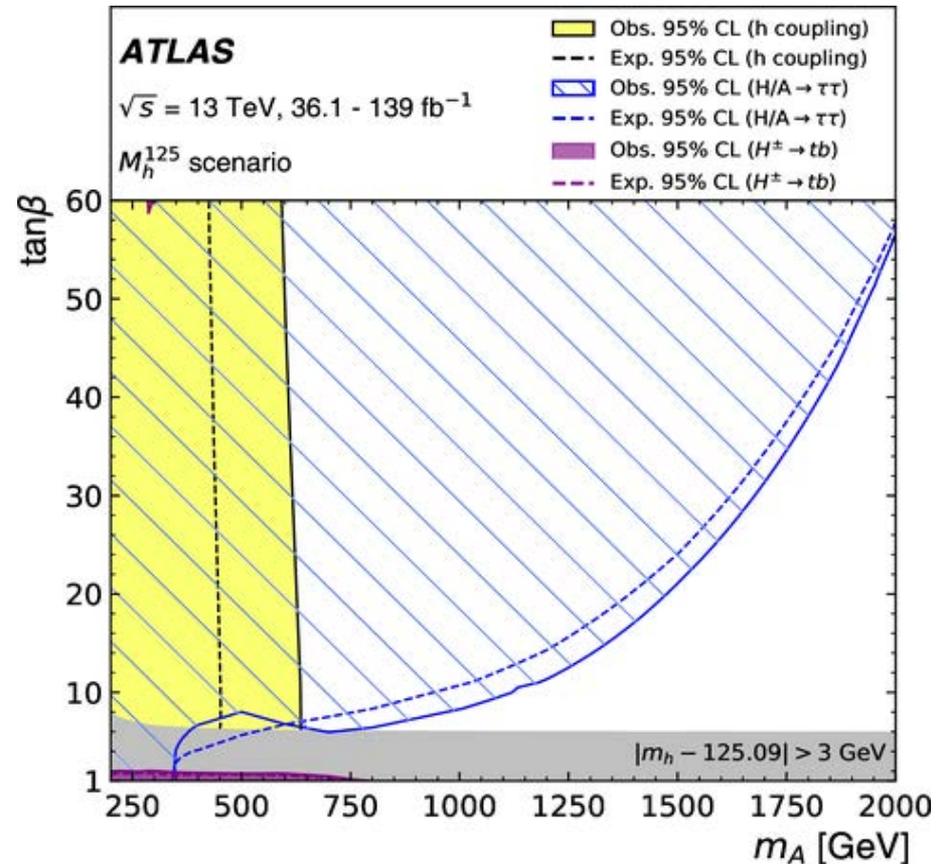

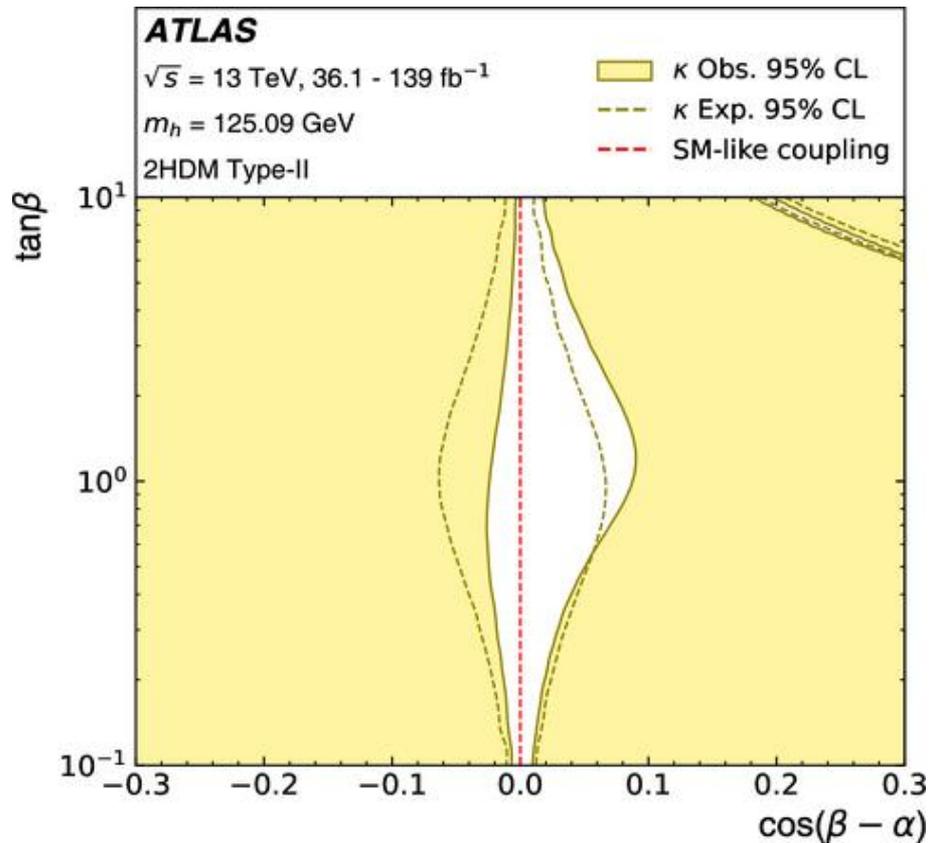

These results can be used to constrain BSM Higgs scenarios.

# Interpretation of $H(125)$ Measurements

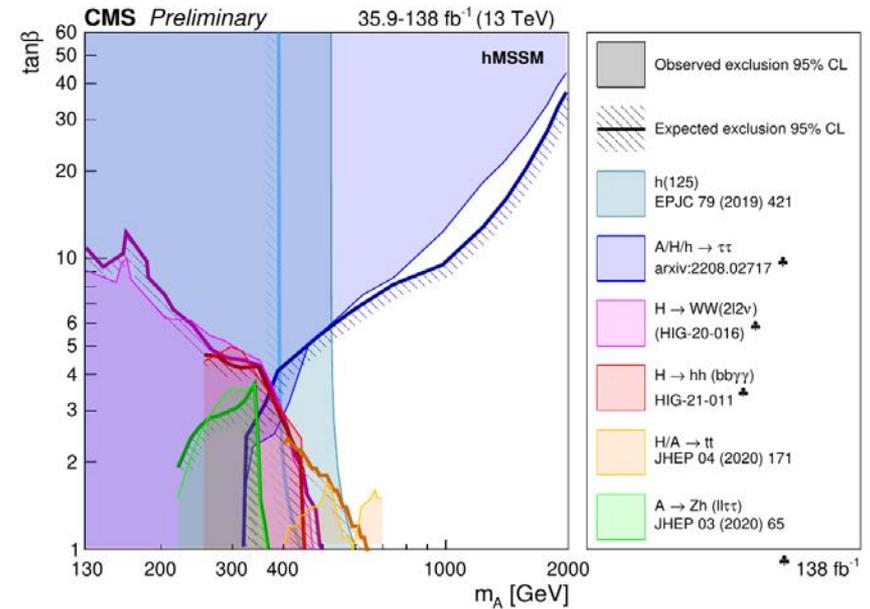

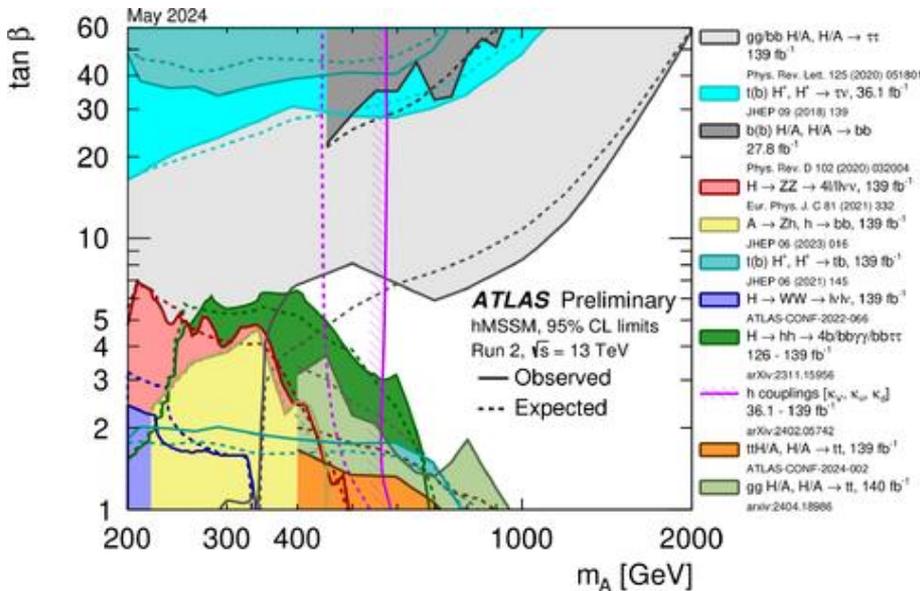

- Production and decay rates of  $H(125)$  are interpreted in 2HDM and MSSM scenarios.

[arXiv:2402.05742](https://arxiv.org/abs/2402.05742)

# MSSM Higgs Status

- Current status of hMSSM.
- Some more full Run2 results to be released.

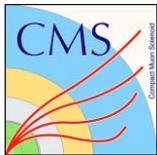

<https://atlas.web.cern.ch/Atlas/GROUPS/PHYSICS/PUBNOTES/ATL-PHYS-PUB-2024-008/>

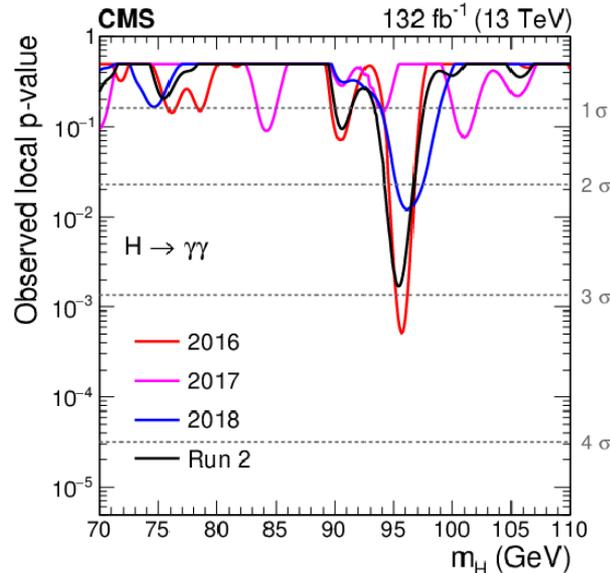

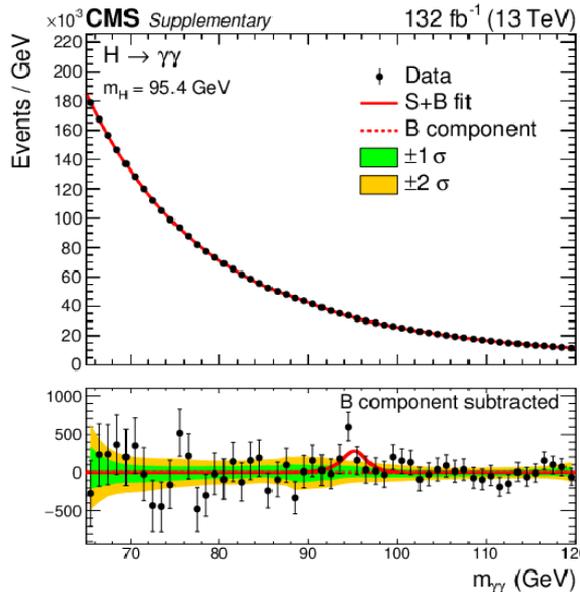

[https://twiki.cern.ch/twiki/bin/view/CMSPublic/SummaryResultsHIG#NEW\\_Summary\\_of\\_MSSM\\_Higgs\\_Boson](https://twiki.cern.ch/twiki/bin/view/CMSPublic/SummaryResultsHIG#NEW_Summary_of_MSSM_Higgs_Boson)

# Low mass $H \rightarrow \gamma\gamma$

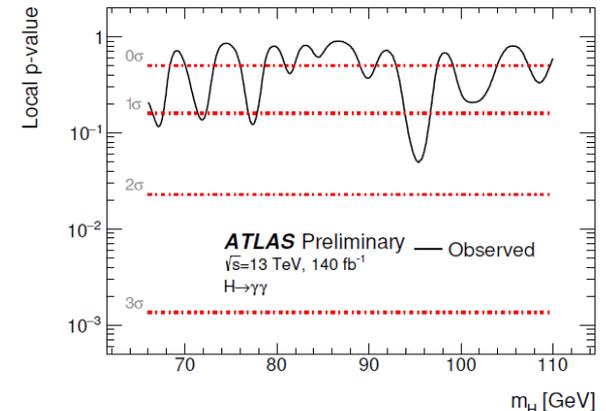

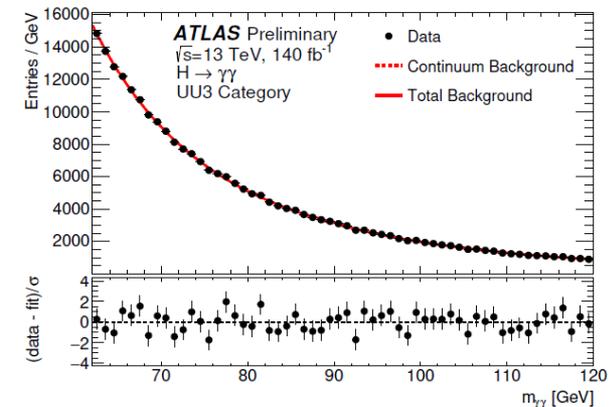

- Many theories can give rise to additional low mass Higgs bosons.
- CMS observes an excess around 95.4 GeV with local (global) significance of  $2.9\sigma$  ( $1.3\sigma$ ).
- ATLAS local significance of  $1.7\sigma$  at 95.4 GeV.

[arXiv:2405.18149](https://arxiv.org/abs/2405.18149)

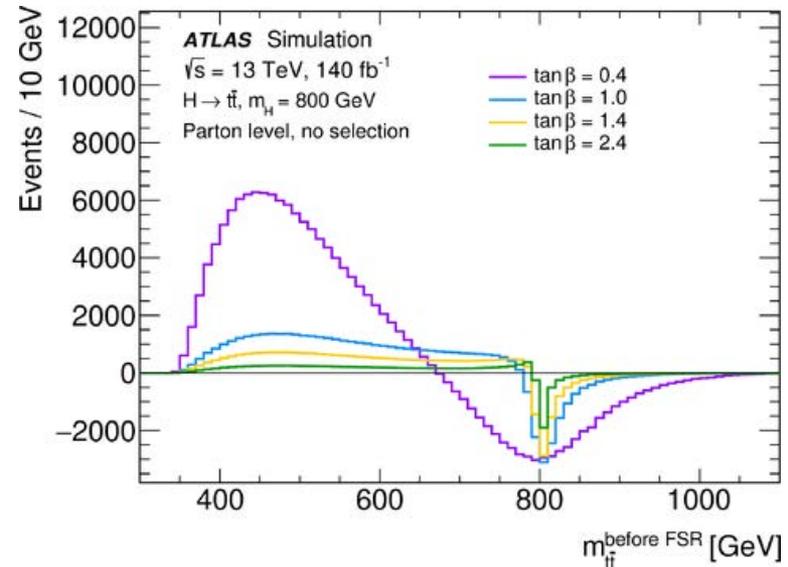

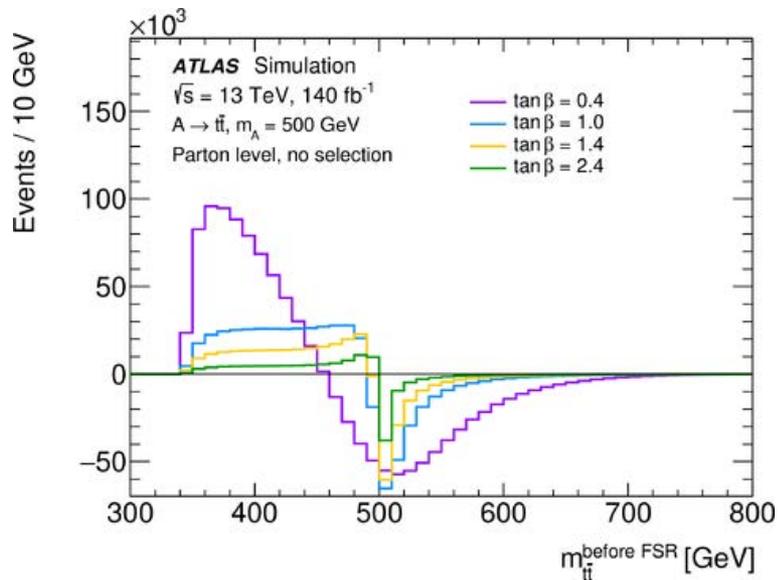

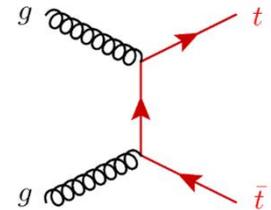

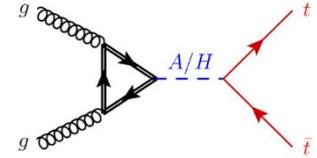

[ATLAS-CONF-2023-035](#)

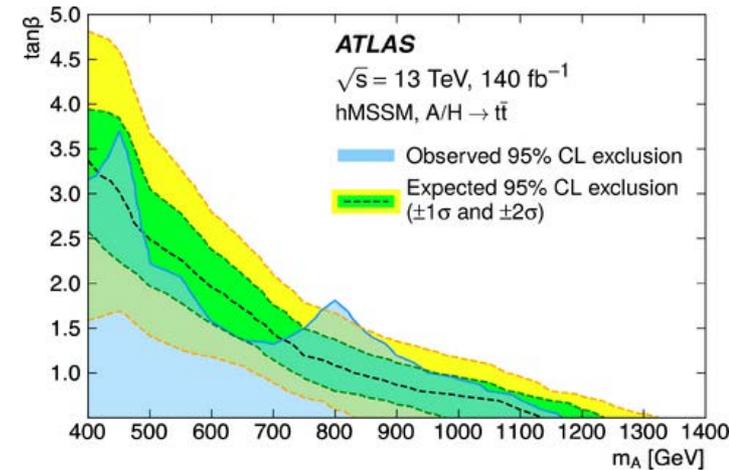

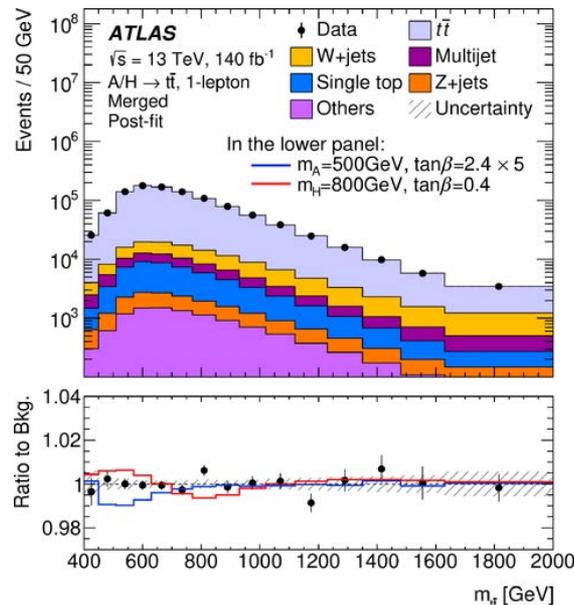

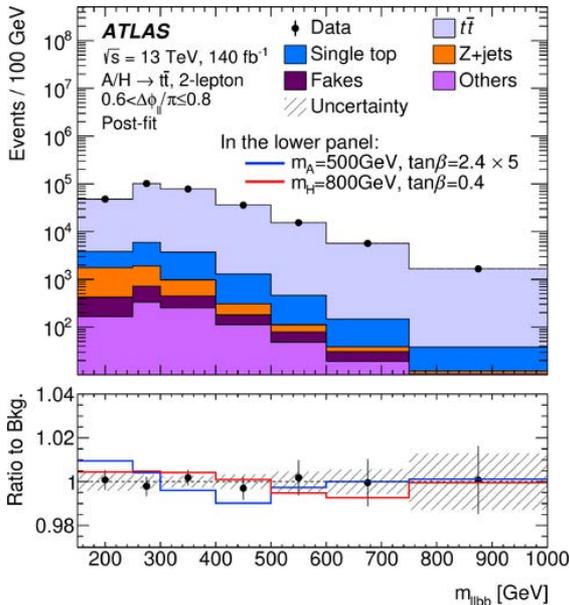

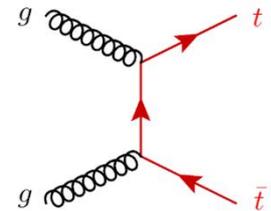

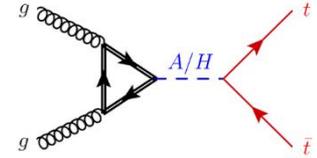

# BSM $H/A \rightarrow t\bar{t}$

- Promising search for heavy  $H/A$  in 2HDM (e.g. MSSM) at low  $\tan\beta$ .
- Consider the interference with SM  $t\bar{t}$  background.

# BSM $H/A \rightarrow t\bar{t}$ (cont'd)

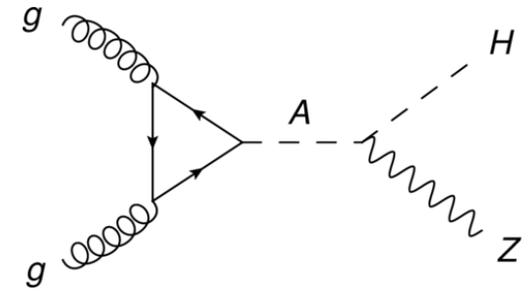

- Analyzed 1 and 2 lepton final states.
- Data were consistent with SM background.
- Most significant deviation was at 800 GeV with a local significance of  $2.3 \sigma$ .

# $A \rightarrow ZH \rightarrow \ell\ell t\bar{t}$

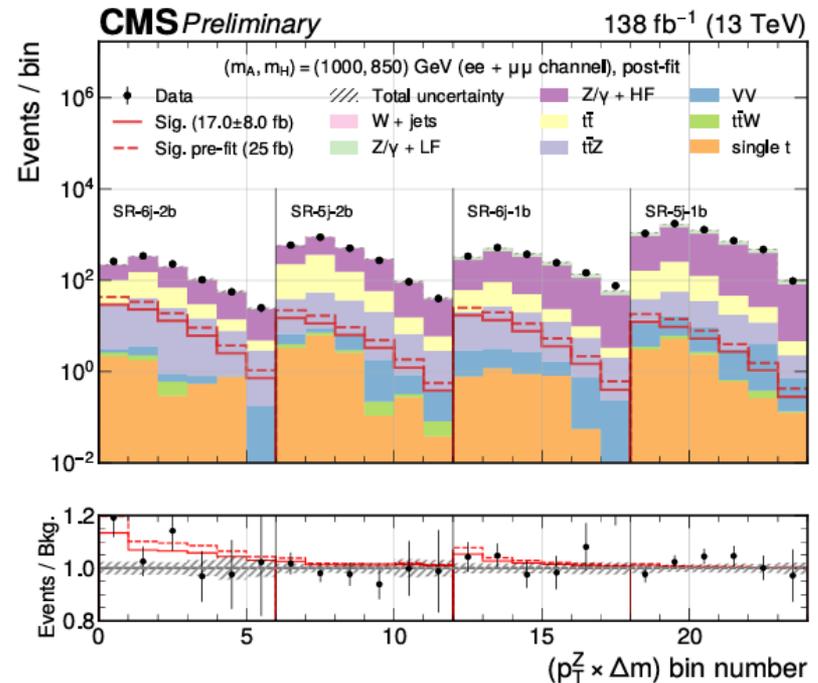

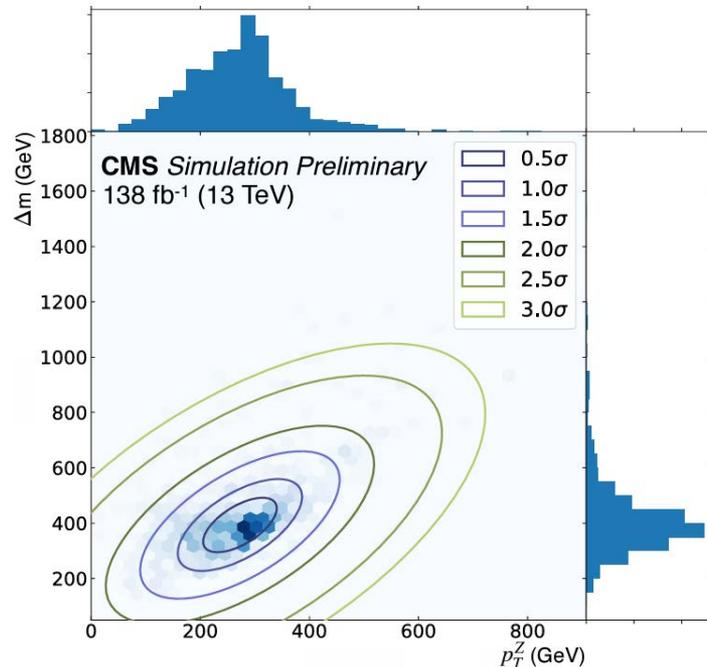

- Region with  $400 \text{ GeV} < m_H \ll m_A$  is unexplored.
- This region is favored by some electroweak baryogenesis scenarios.
- Analyze events with  $\ell^+\ell^- + n_j(1, \geq 2b)$
- Elliptical bins  $(\Delta m, p_Z)$  define final discriminant
- No significant deviation from SM background.

*Involves two BSM Higgs bosons*

Expected  $(\Delta m, p_Z)$  distribution for signal for  $m_A = 1000 \text{ GeV}, m_H = 600 \text{ GeV}$

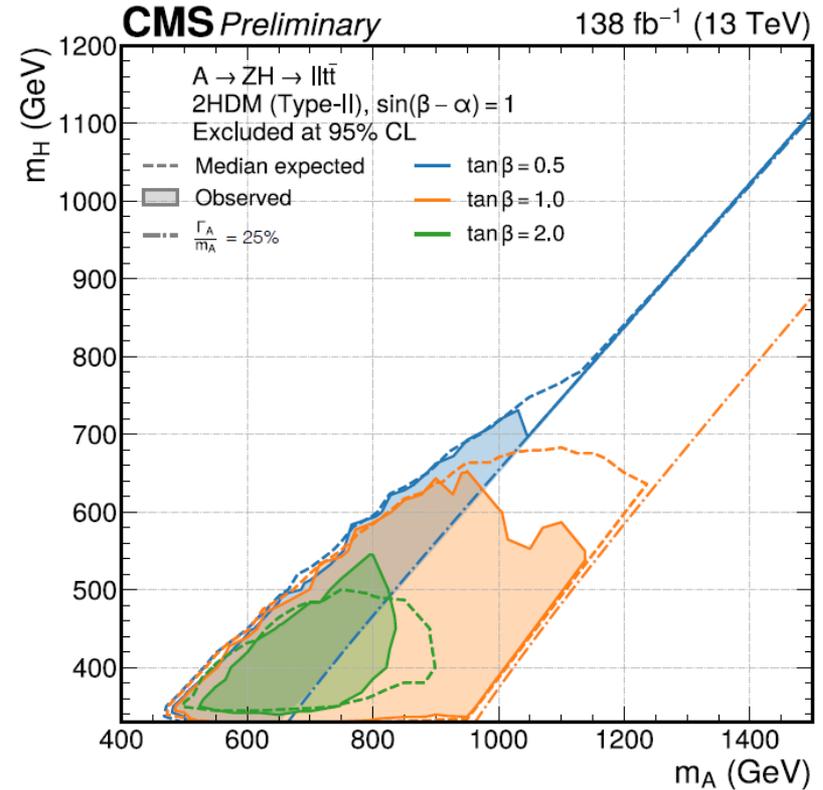

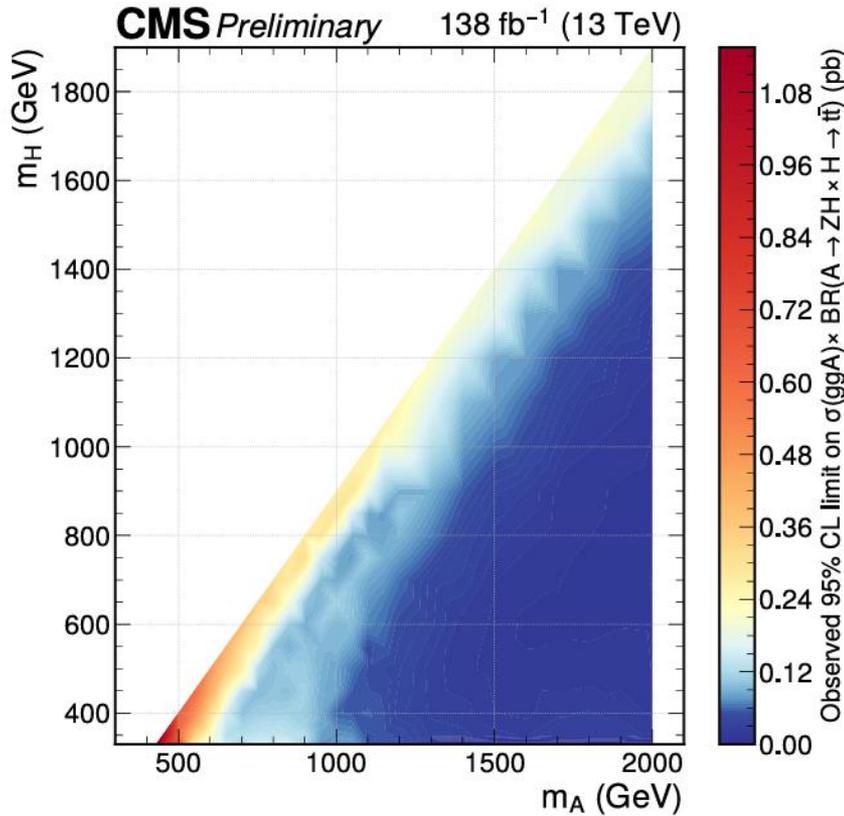

Data distribution for signal hypothesis of  $m_A = 1000 \text{ GeV}, m_H = 850 \text{ GeV}$

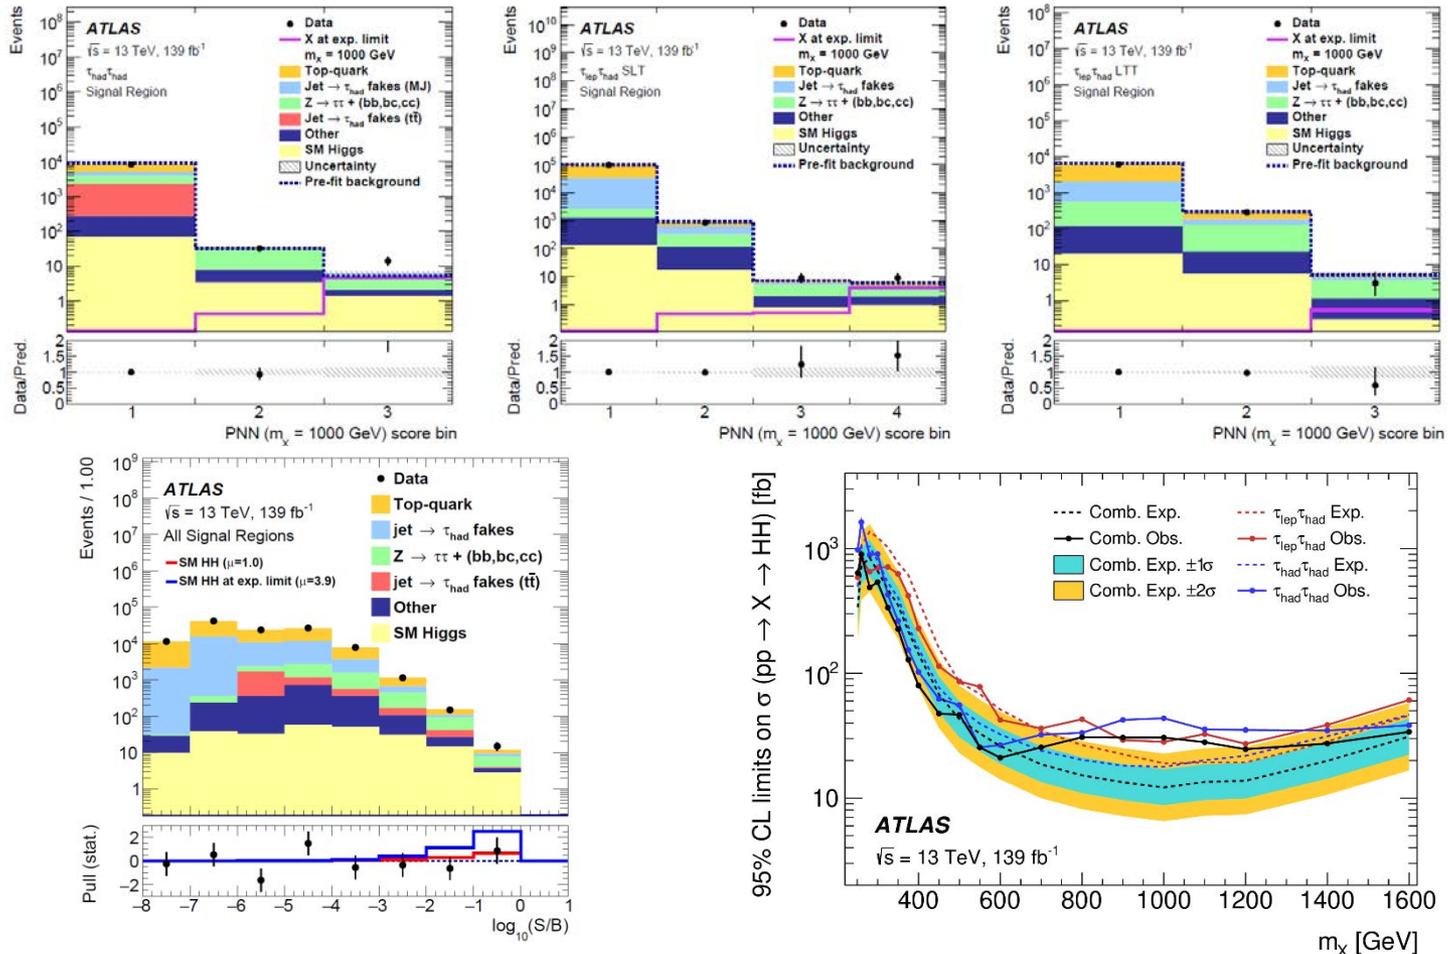

# $A \rightarrow ZH \rightarrow \ell\ell t\bar{t}$ (cont'd)

Exclusion limits for Type II 2HDM are set at low  $\tan\beta$  values.

# $H \rightarrow h_{125} h_{125} \rightarrow bb\tau\tau$

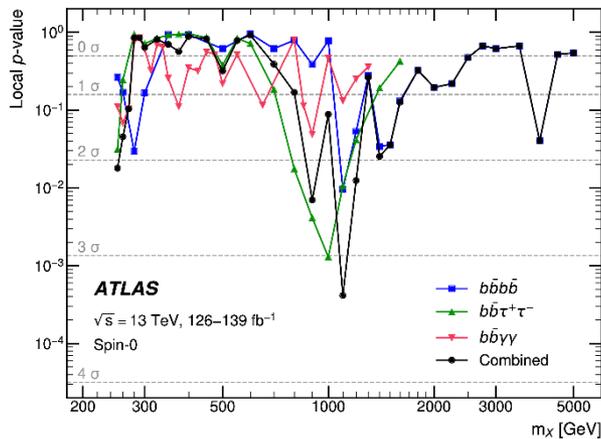

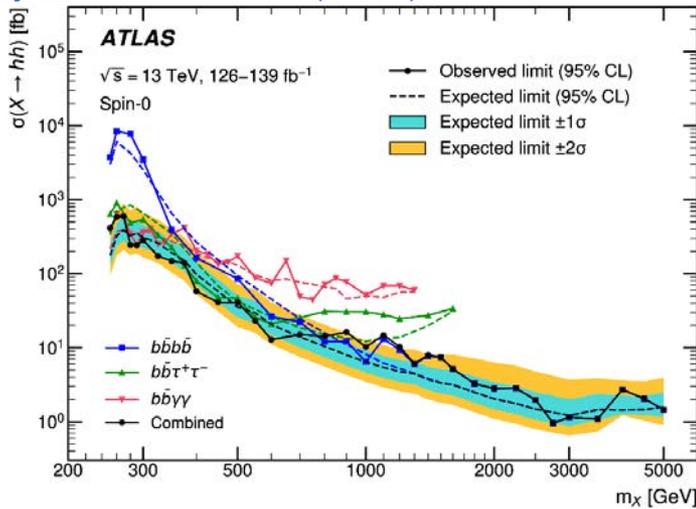

- $\tau_{had}\tau_{had}$  (single and double  $\tau_{had-vis}$  triggers),  $\tau_{lep}\tau_{had}$  (single lepton and lepton+ $\tau_{had-vis}$  triggers). Require two  $b$ -jets.
- PNN trained with inputs including  $m_{hh}, m_{\tau\tau}, m_{bb}$

Largest deviation at 1 TeV with local (global) significance of  $3.1\sigma$  ( $2.0\sigma$ ).

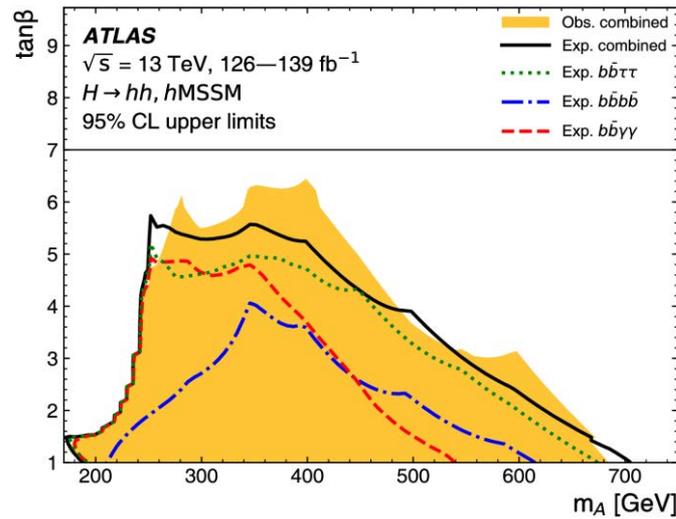

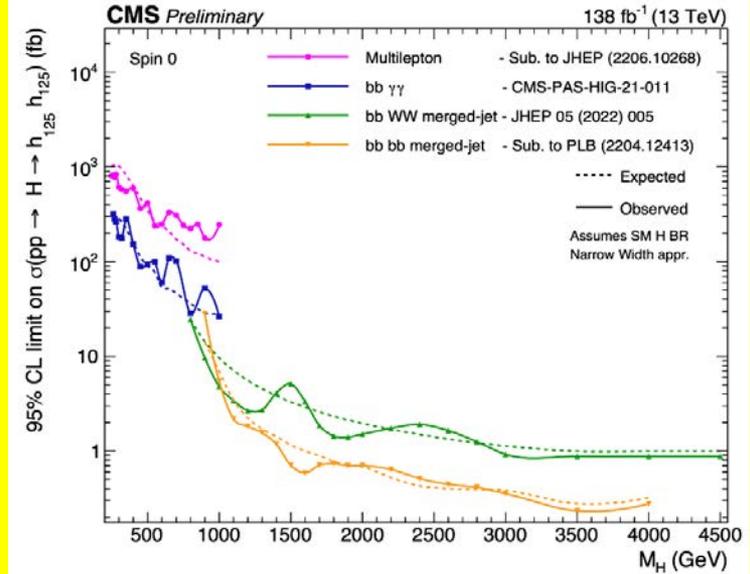

# $H \rightarrow h_{125} h_{125}$

Phys. Rev. Lett. 132 (2024) 231801

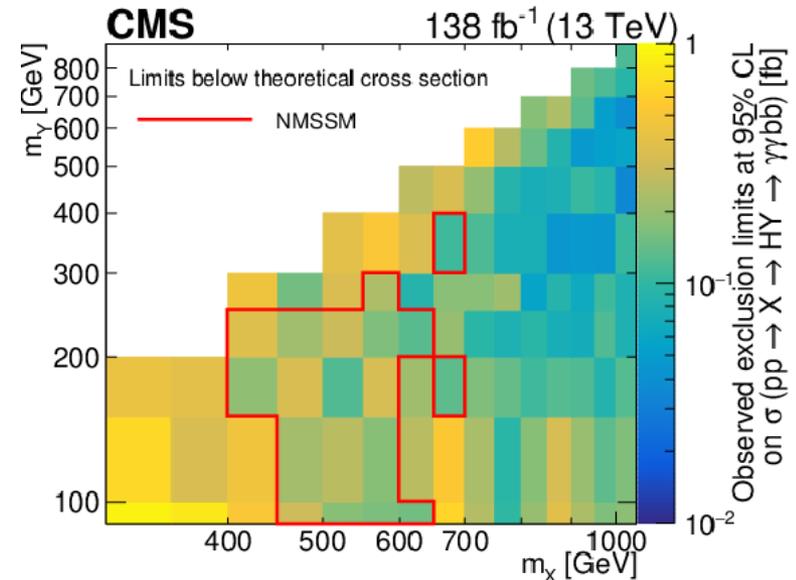

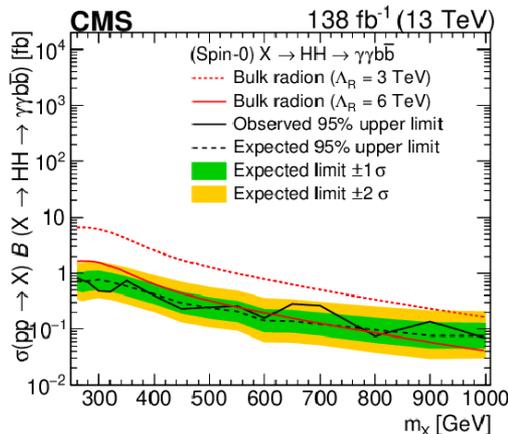

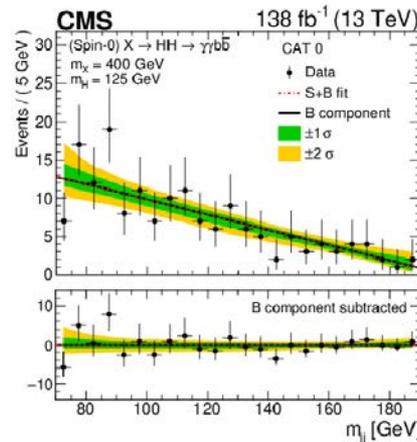

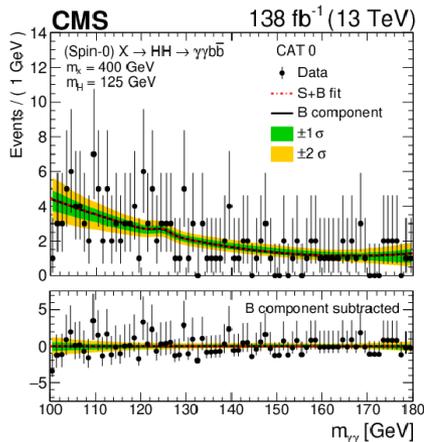

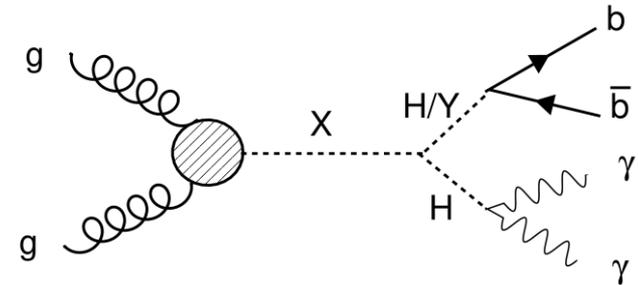

Largest 1.1 TeV, with a local (global) significance of  $3.3\sigma$  ( $2.1\sigma$ ).

<https://twiki.cern.ch/twiki/bin/view/CMSPublic/SummaryResultsHIG>

# $X \rightarrow HH/HY \rightarrow b\bar{b}\gamma\gamma$

- MSSM motivated search.
- $X$ : heavy spin-0 particle.
  - Spin-2 was also searched for.
- $Y$ : spin-0 particle. Can be another  $H(125)$ .
- BDT was trained to divide signal regions.

Involves two BSM Higgs bosons.  
Interpretation with NMSSM.

# Searches in 2HDM+Singlet/NMSSM

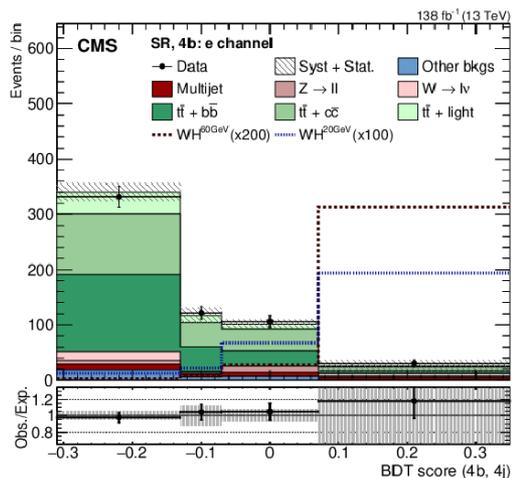

– 7 Higgs Bosons

$$h_1, h_2, h_3, H^+, H^-, a_1, a_2$$

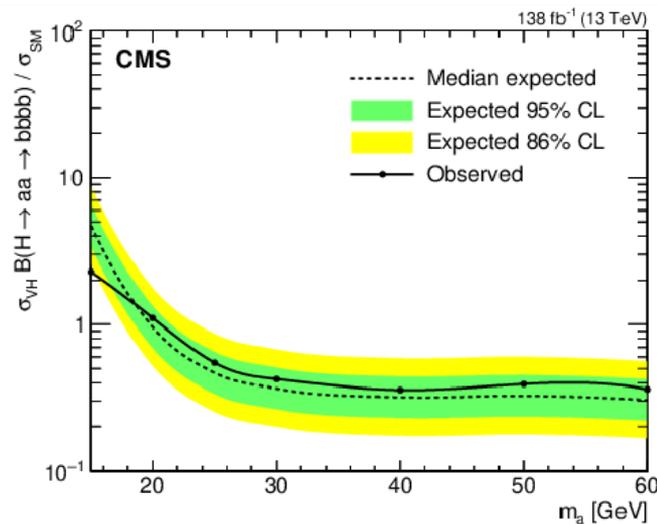

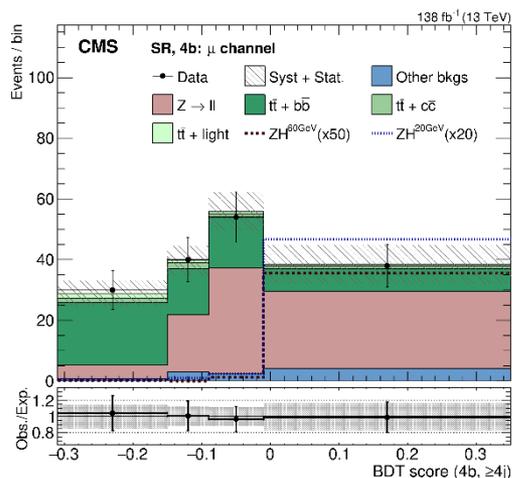

# $VH, H \rightarrow aa \rightarrow b\bar{b} b\bar{b}$

- $a \rightarrow b\bar{b}$  is usually the dominant decay mode above  $b\bar{b}$  threshold.
- $Z \rightarrow \ell\ell$  and  $W \rightarrow \ell\nu$  channels.
- 3 or 4 b-tagged jets.
- BDT discriminants trained for  $ZH$  and  $WH$  channels for signal separation.

## $WH \rightarrow e\nu + 4b$ chan.

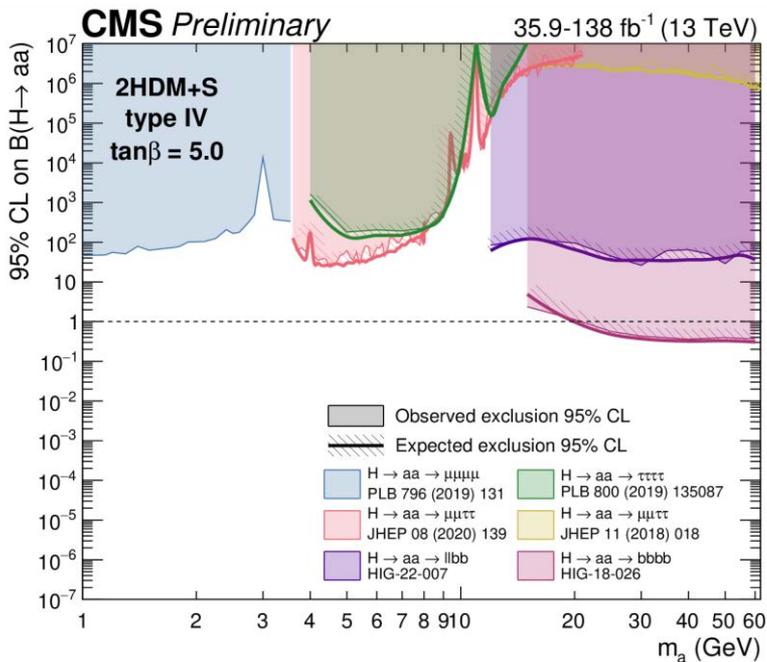

## $ZH \rightarrow \mu\nu + 4b$ chan.

[ATL-PHYS-PUB-2021-008](#)

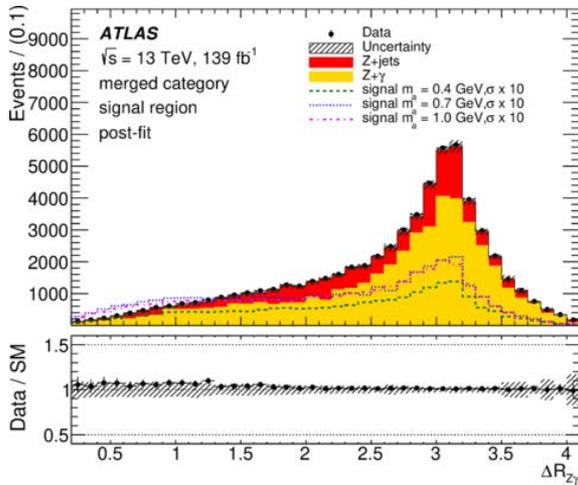

# $H \rightarrow Za, a \rightarrow \gamma\gamma$

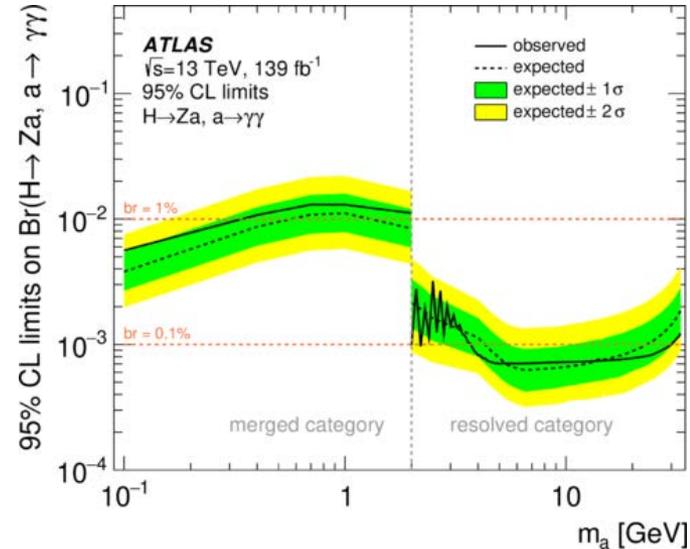

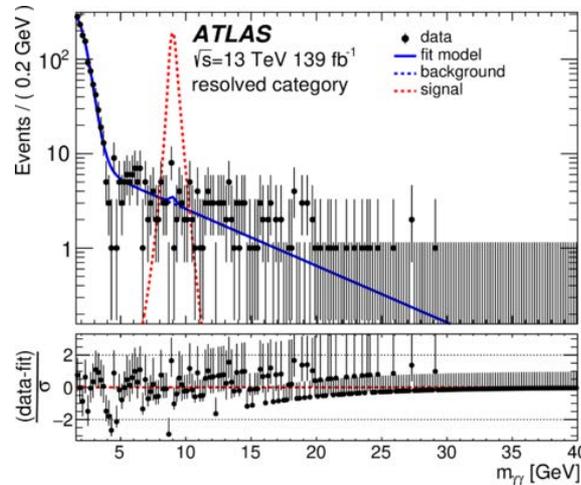

- $H \rightarrow Za$  decay is unexplored.
- $H \rightarrow Za$  decay is also motivated by axion models.
- Analysis split into resolved and merged categories based on angular separation of  $\gamma$ 's.
- Main backgrounds from  $Z + jets$  ( $\pi^0$  decays) and  $Z + \gamma$ .
  - Composition is 25:75 in merged, 90:10 in resolved.

## Merged

## Resolved

CMS has a comparable results in this search: [Phys. Lett. B 852 \(2024\) 138582](https://arxiv.org/abs/2405.12345).

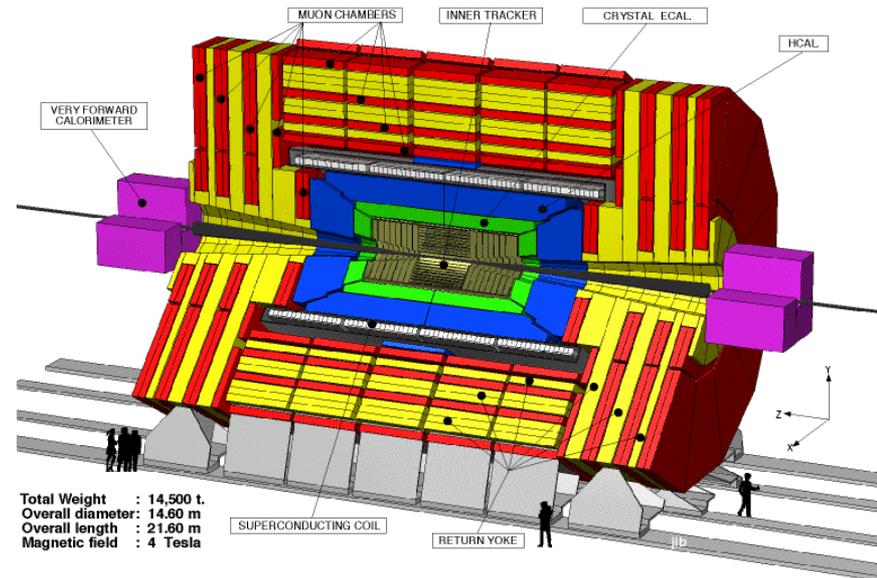

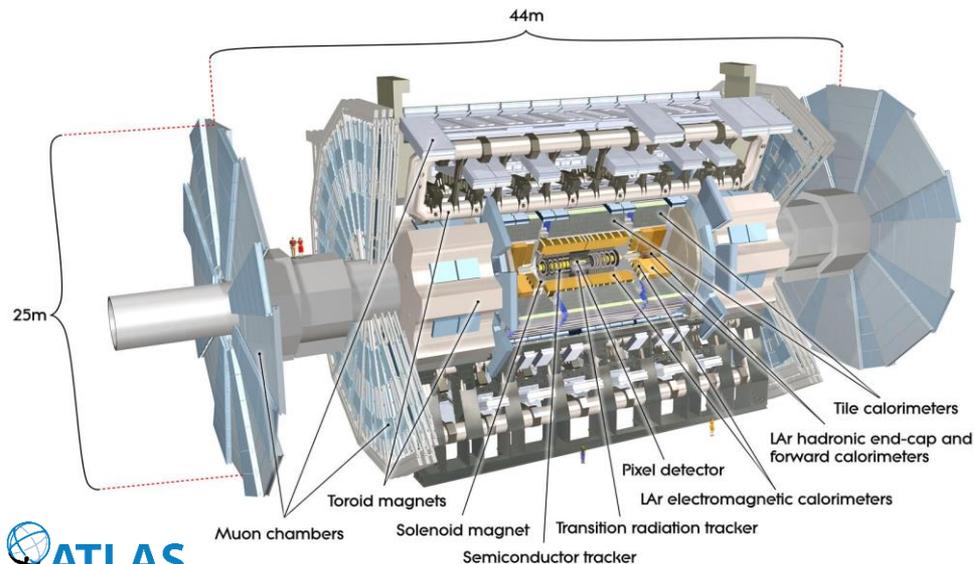

# Summary

- LHC is under Run3 operation in 2022-2025.
  - ATLAS/CMS recorded  $\sim 100 \text{ fb}^{-1}$  of 13.6 TeV  $p - p$  collision data in Run 3.
  - Plan to have  $250 \text{ fb}^{-1}$  at end of 2025.
  - Collaborations ramping up Run 3 analyses.
- Full Run 2 data ( $\sim 140 \text{ fb}^{-1}$  at 13 TeV) analysis are going on.
  - Some more full Run2 results to be released for 2HDM, MSSM scenarios.
  - Complicated signatures and heavier masses are searched for.
  - Advanced theoretical scenarios are explored.
- Run 3 dataset will enable searches and measurements at higher precision.

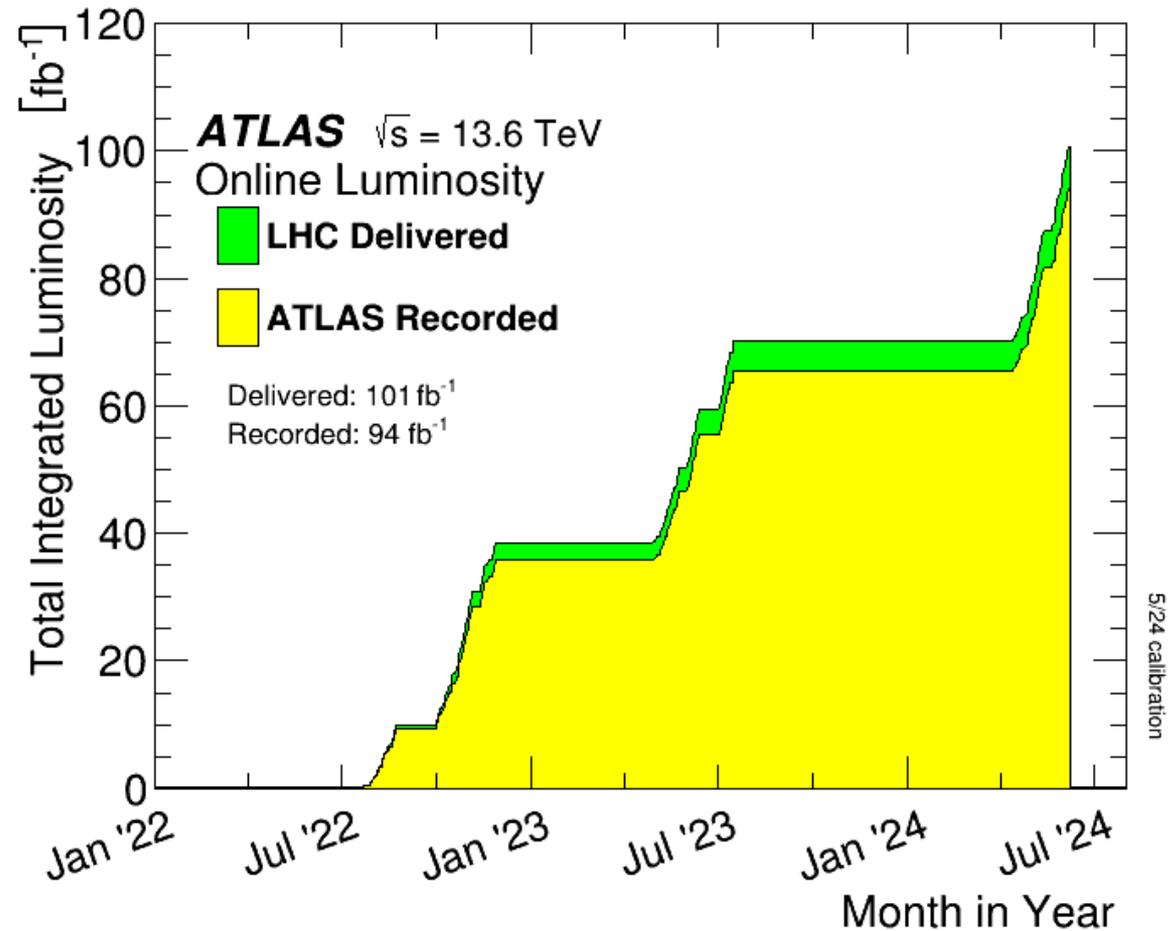

# Backup

# ATLAS and CMS at LHC

  - Searches for BSM physics: BSM Higgs, Supersymmetry, ...

# Luminosity Delivered in Run 3

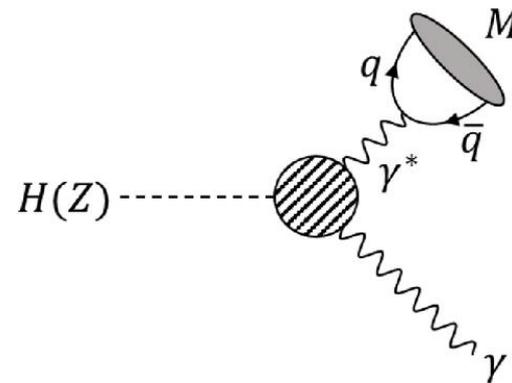

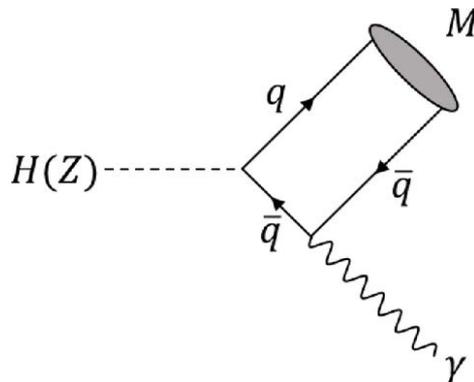

# Searches for rare $H(125)$ decays

# Rare Decays $H(125) \rightarrow \gamma + Meson$

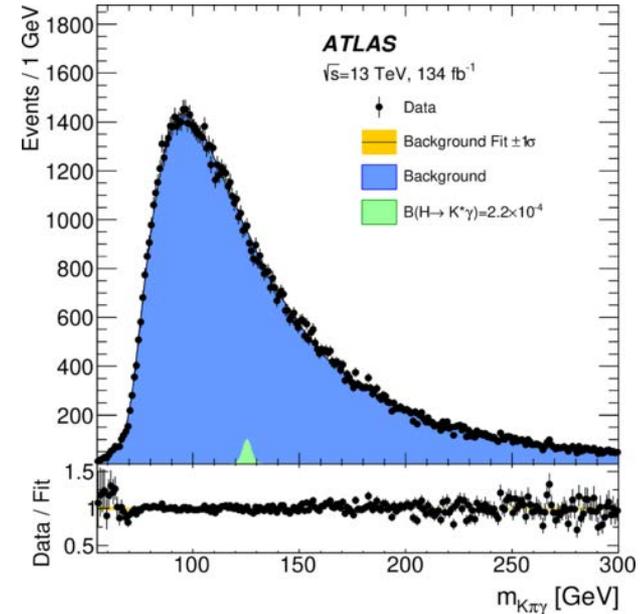

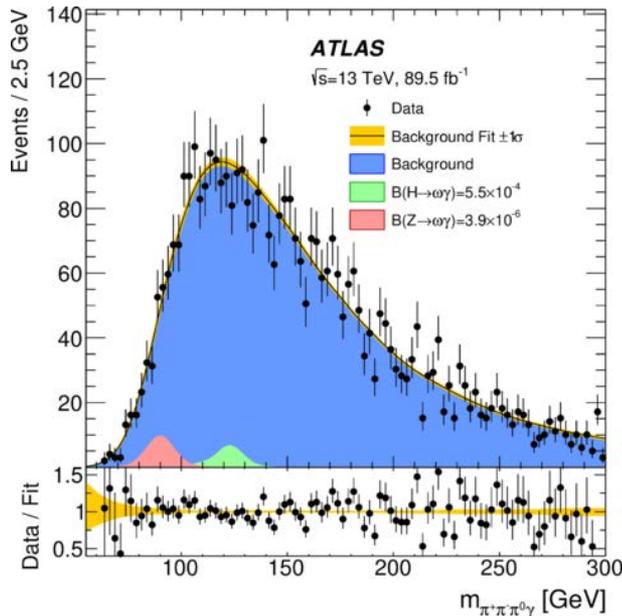

## Search Motivation

- SM predicts very small branching fractions.
- $H \rightarrow \gamma(q\bar{q})$  occur through direct Yukawa coupling and through  $H \rightarrow \gamma\gamma^* \rightarrow \gamma(q\bar{q})$ .
  - Yukawa coupling to 1<sup>st</sup> and 2<sup>nd</sup> generation is unknown.
- BSM processes can enhance the branching fractions.
- Processes like  $H \rightarrow K^*\gamma$  can be sensitive to flavor violating Yukawa couplings.

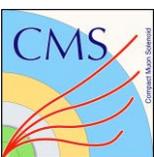

# Rare Decays $H(125) \rightarrow \gamma\omega/\gamma K^*$

- Trigger on  $\gamma$  + tracks. Utilize modified version of  $\tau$  trigger for  $\gamma K^*$ .
- Meson reconstructions:
  - $\omega \rightarrow \pi^+\pi^-\pi^0$ :  $279 < m(\pi^+\pi^-\pi^0) < 648$  MeV.  $\pi^0$  reconstructed as Calorimeter cluster.
  - $K^* \rightarrow K^+\pi^-$ :  $790 < m(\pi^+\pi^-\pi^0) < 990$  MeV.

	Observed Upper Limit
$Br(H \rightarrow \omega\gamma)$	$5.5 \times 10^{-4}$
$Br(H \rightarrow K^*\gamma)$	$2.2 \times 10^{-4}$

# Rare Decays $H(125) \rightarrow \gamma\rho, \gamma\phi, \gamma K^{*0}$

- Mesons are reconstructed as a track pair.

CMS-PAS-HIG-23-005

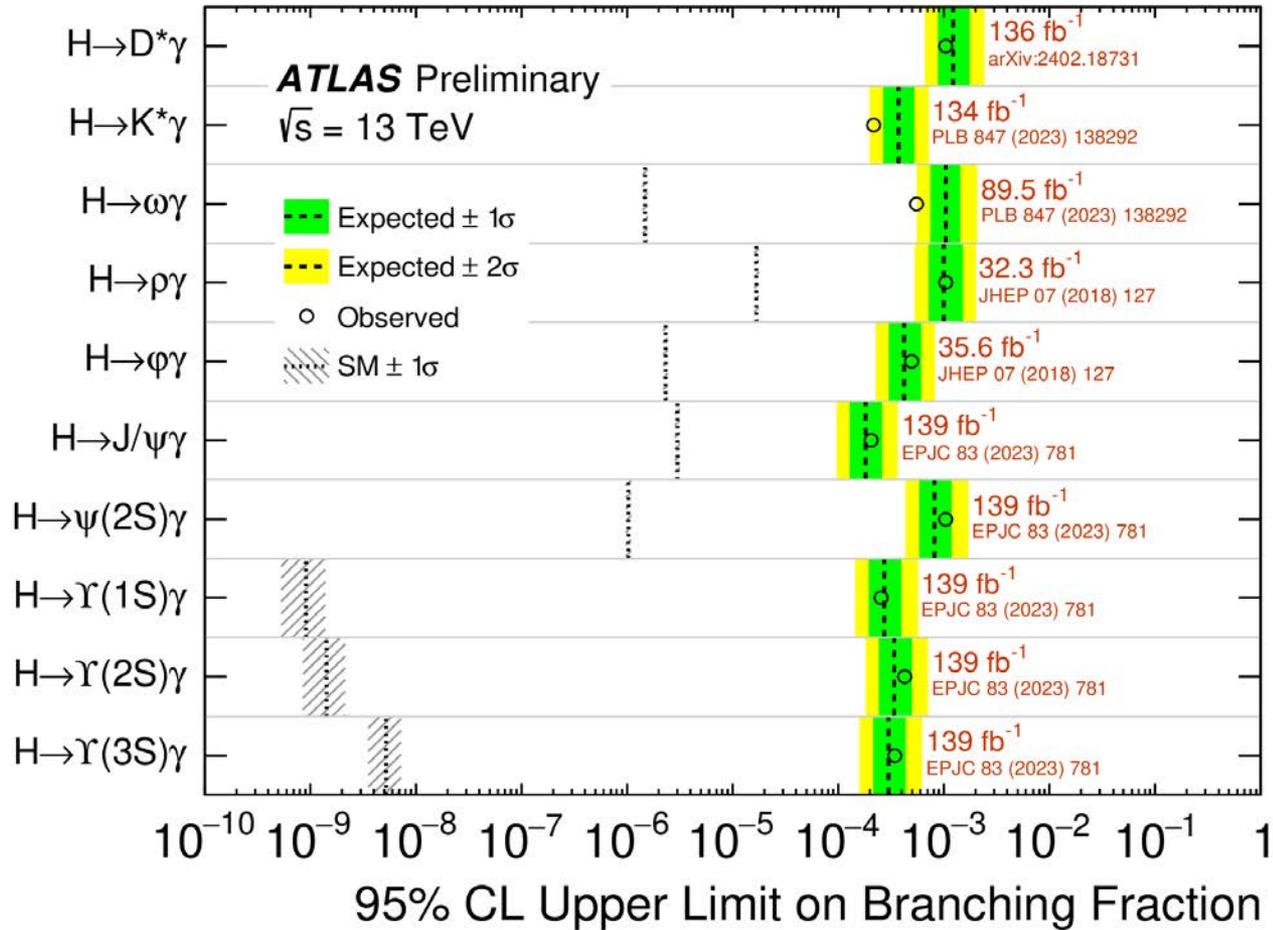

Obtained most stringent 95% CL experimental upper limits to date:

$$\begin{aligned} \text{Br}(H \rightarrow \gamma\rho^0) &\leq 3.74 \times 10^{-4} \\ \text{Br}(H \rightarrow \gamma\phi) &\leq 2.97 \times 10^{-4} \\ \text{Br}(H \rightarrow K^{*0}\phi) &\leq 1.71 \times 10^{-4} \end{aligned}$$

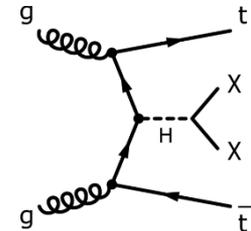

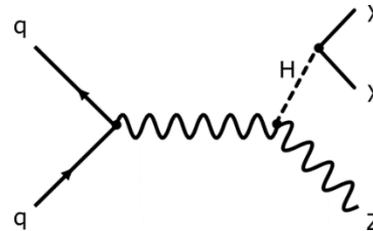

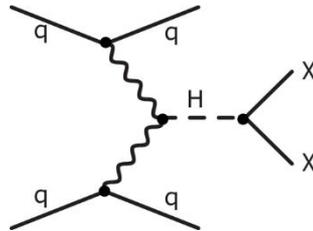

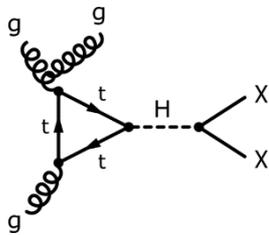

# Rare Decays $H(125) \rightarrow \gamma + Meson$

[ATL-PHYS-PUB-2023-004](#)

# $H(125) \rightarrow \textit{invisible}$

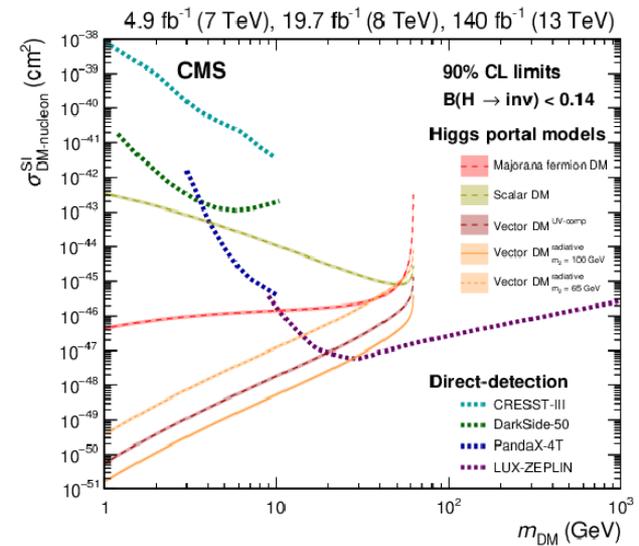

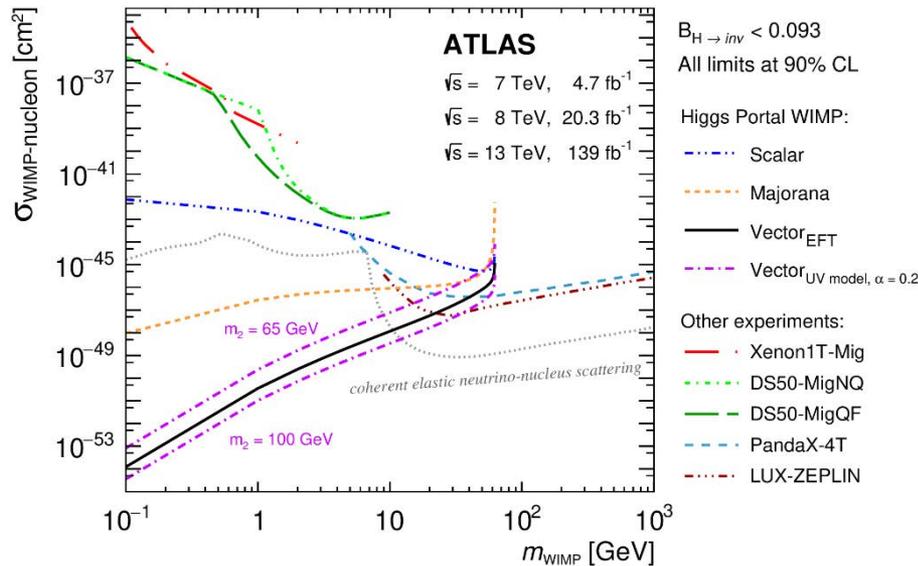

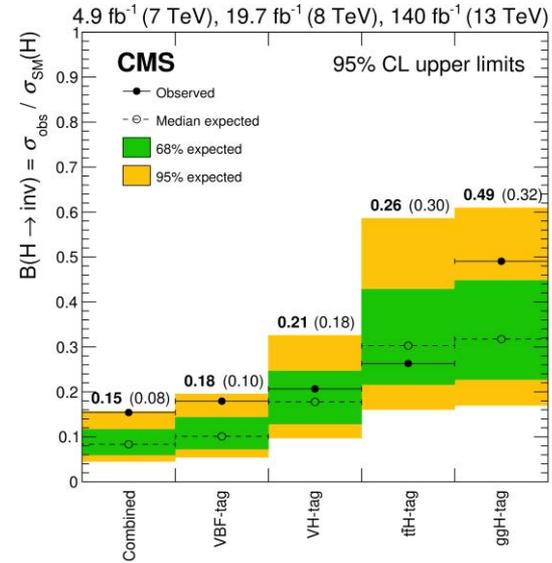

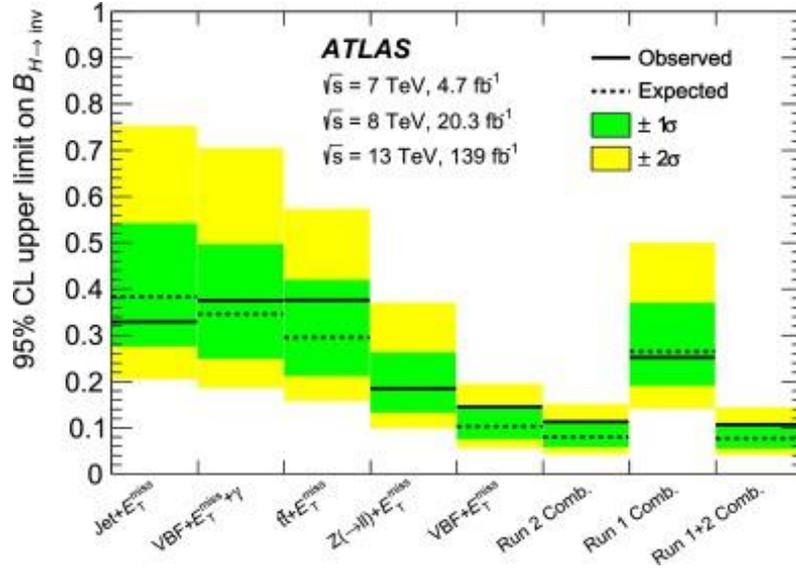

- Massive DM can couple to Higgs boson.
- Some theories predict that  $H$  can act as a portal between DM and SM sector.
- Both ATLAS and CMS searched for invisible Higgs decays in different production modes.

Fig. 4. Upper limit at the 90% CL on the spin-independent WIMP-nucleon scattering cross-section as a function of the WIMP mass for direct detection experiments and the interpretation of the  $H \rightarrow$  invisible combination result in the context of Higgs portal models considering scalar, Majorana and vector WIMP hypotheses. For the vector case, results from UV-complete models are shown (pink curves) for two representative values for the mass of the predicted Dark Higgs particle ( $m_h$ ) and a mixing angle  $\alpha=0.2$ . The uncertainties from the nuclear form factor are smaller than the line thickness. Direct detection results are taken from Refs. [65], [66], [67], [68]. The neutrino floor for coherent elastic neutrino-nucleus scattering (dotted gray line) is taken from Refs. [69], [70], which assume that germanium is the target over the whole WIMP mass range. The regions above the limit contours are excluded in the range shown in the plot.

## 2.3 Objection on EFT, first UV model

[arXiv:2107.01252 \[hep-ph\]](#)

In the EFT approach used in LHC Run-1 [23], the mass of the VDM was entered arbitrarily, which leads to a non-renormalisable Lagrangian and violation of unitarity [25]. For this reason, it is safer to consider a better framework, i.e. a simple UV completion with a **dark Higgs** sector that gives mass to the vector DM via spontaneous electroweak symmetry breaking (EWSB). The simplest renormalisable Lagrangian for the Higgs portal VDM in such a UV model is given by Ref. [25]:

$$\mathcal{L}_{VDM} = -\frac{1}{4}V_{\mu\nu}V^{\mu\nu} + D_\mu\Phi^\dagger D^\mu\Phi - \lambda_\Phi(\Phi^\dagger\Phi - \frac{\nu_\Phi^2}{2})^2 - \lambda_{\Phi H}(\Phi^\dagger\Phi - \frac{\nu_\Phi^2}{2})(H^\dagger H - \frac{\nu_H^2}{2}), \quad (6)$$

where  $\Phi$  is the **dark Higgs** field which generates a nonzero mass for the VDM through spontaneous  $U(1)'$  breaking;  $D_\mu\Phi = (\partial_\mu + ig_X Q_\Phi V_\mu)\Phi$  and  $g_X$  is the coupling constant.

From the Lagrangian, one can derive the invisible branching fraction of the Higgs decay [25]:

$$\Gamma_{\text{inv}}^H = \frac{g_X^2}{32\pi} \frac{m_H^3}{m_V^2} \left(1 - 4\frac{m_V^2}{m_H^2} + 12\frac{m_V^4}{m_H^4}\right) \left(1 - 4\frac{m_V^2}{m_H^2}\right)^{1/2}, \quad (7)$$
